

List of figures

1.1	High level overview of subclonal reconstruction principles	15
2.1	B-allele frequency example scenarios	24
2.2	Example segmentation with SV breakpoints included	29
2.3	An copy number profile before and after GC content correction	30
2.4	LogR before and after GC content correction	31
2.5	Four example SNVs to illustrate how copy number alters variant allele frequencies	32
2.6	Example drawing showing stick breaking property in different stages	37
2.7	Main output figure from a DPClust run	38
2.8	Output of a DPClust run on PD4120 with and without co-clustering CNAs	40
2.9	Output of the MPEAR cluster finding post-processing step	42
2.10	Output of the binomial probability cluster assignment procedure	43
2.11	A graphical overview of the automated tree building method	46
3.1	Example of a simulated copy number profile	54
3.2	Comparison of real and simulated total copy number and multiplicity distributions	55
3.3	Simulation of a copy number profile with LOH	57
3.4	Simulated copy number on a very fragmented segmentation	57
3.5	Copy number simulations on different segmentations	58
3.6	Simulation parameters were sampled from a grid	59
3.7	Overview of the resimulation process	64
3.8	Example output from the resimulation process	66
3.9	Overview of performance on the SimClone1000 data set	67
3.10	In depth comparison of DPClust results against the truth	68
3.11	Comparison of size and location of separable and inseparable clusters	68
3.12	Overview of gained mutations that are assigned to a subclone.	70
3.13	Second example of a tumour where gained mutations are assigned to a subclone.	72
3.14	Fewer gained mutations are assigned to a subclone when the number of MCMC iterations is increased.	73
3.15	Second example of a tumour where gained mutations are assigned to a subclone.	74
3.16	Evaluation of the performance of Battenberg	75
3.17	Compare Battenberg purity calls on simulated and true b-allele frequencies	76
4.1	Quality control figure introduction	79
4.2	Large homozygous deletion example	81
4.3	Resolved large homozygous deletion example	82

4.4	Detailed copy number figures with segments close to 50% of tumour cells . . .	84
4.5	QC figure corresponding to an empty odd numbered copy number state . . .	85
4.6	Resolved empty odd numbered copy number state	86
4.7	QC failure when the copy number profile is not it with a clonal alteration . . .	88
4.8	QC example with a clear large mutation cluster at 50% of tumour cells . . .	90
4.9	Resolved clear large mutation cluster at 50% of tumour cells	91
4.10	QC example with an empty mutation copy number state	93
4.11	Resolved empty mutation copy number state	94
4.12	Compare Battenberg purity and ploidy with and without refitting	97
4.13	Example of an exception to the empty copy number state metric	99
5.1	General clinical annotations of N010985	103
5.2	The copy number and subclonal architecture of N010985	105
5.3	Detailed figures showing the mutations measured in <i>NF1</i> and <i>CBFB</i>	106
5.4	Overview of mutational signatures	107
5.5	Kataegis regions shown by CCF	108
5.6	Timing of gains	109
5.7	The life history of N010985	110
5.8	The life history can be represented by two possible phylogenetic trees	111
6.1	Number of copy number breakpoints called per method	117
6.2	Agreement on copy number for different confidence levels	122
6.3	Battenberg QC figure for sample SA305293	125
6.4	Raw copy ratio and allele specific copy ratio for sample SA305293	126
6.5	Battenberg QC figure for sample SA529774	127
6.6	Raw copy ratio and allele specific copy ratio for sample SA529774	128
6.7	Battenberg QC figure for sample SA533746	129
6.8	Raw copy ratio and allele specific copy ratio for sample SA533746	130
6.9	Consensus purity construction examples	131
6.10	Comparison of performance of subclonal reconstruction methods	132
6.11	Pairwise comparison of subclonal architecture callers	134
6.12	The number of reads per chromosome copy determines the power to detect subclones	136
6.13	Example of the <i>winner's curse</i> effect	137
7.1	A pan-cancer overview of intra-tumour heterogeneity	141
7.2	Overview of detected subclones in metastasis and relapse tumours	143
7.3	Flow diagram showing the filters applied to obtain the driver overview	144
7.4	Overview subclonal drivers	145
7.5	Counts of clonal and subclonal drivers	146
7.6	Corrections for the <i>winner's curse</i> effect	148
7.7	Positive selection in subclonal mutations	148
7.8	dN/dS in neutral vs. non-neutral tumours	150
7.9	Clinically actionable drivers in subclones	151
7.10	Evidence of additional heterogeneity from phased mutations	153
7.11	Timing of driver mutations and relative ordering of somatic events	156
7.12	Mutational signature activity and real-time timing of whole genome duplica- tions	157
